## Technical Notes

Readers should note that fluctuations in the number of disease reports per year may be influenced by reporting issues. These issues may vary by disease. For example, the final implementation of HIV/AIDS and syphilis reporting integration into the NC Electronic Disease Surveillance System (NCEDSS) occurred during November-December of 2012. In order to convert, deduplicate and merge patient information into NCEDSS, data being entered into the production database was suspended for approximately one month. While most of the backlog was cleared at the time the reports were generated, there may be some cases still under investigation that have not been completed and submitted. These are primarily cases diagnosed in the last months of 2012. We urge caution in the interpretation of any trends involving 2012 data at this time. Readers should also be aware that HIV and AIDS data are presented by date of diagnosis rather than date of report. Please see the individual surveillance disease notes below for more information.

### About the authors

North Carolina law requires that diagnoses of certain communicable diseases, including sexually transmitted diseases (STDs), be reported to local health departments that in turn report the information to the state. The Communicable Disease Surveillance Unit (CDSU) is the designated recipient for STD morbidity reports at the state level and is responsible for aggregating these reports and providing statewide information about these diseases to others, including the Centers for Disease Control and Prevention (CDC) in Atlanta, Georgia. The CDSU is part of the Communicable Disease Branch within the North Carolina Division of Public Health.

### About the content of this report

This document, the *North Carolina 2012 HIV/STD Surveillance Report*, includes summary tables of surveillance reports and other information for human immunodeficiency virus (HIV) disease, (acquired immunodeficiency syndrome) (AIDS), chlamydia, gonorrhea, and syphilis. In some instances, total numbers of reports may not agree between separate cross-tabulations due to missing values for some variables.

Some statistics are provided for the geographic regions as displayed on the back cover. The state demographer and the GIS lab at the State Center for Health Statistics have produced a Geographic Regional Classification scheme based on "physiographic" qualities. Western Region: the counties west of (and including) Surry, Wilkes, Caldwell, Burke, and Rutherford. Eastern Region: everything east of (and including) Northampton, Halifax, Nash, Johnston, Cumberland, Hoke, Harnett, and Scotland. Piedmont Region: the counties in between the Western Region and the Eastern Region.

Rates are presented for several categories of race/ethnicity, age groups and gender for each disease. Rates are also presented for counties across the state. Rates are expressed as cases per 100,000 population. Rate denominators were calculated using

the available bridged race population estimates from the National Center for Health Statistics. Because bridged race population estimates were unavailable for 2012, 2011 estimates were used as denominators in rate calculation for 2012. Thus, the 2012 rates should be considered *preliminary* rates. More information about bridged race categories is available at the website, [www.cdc.gov/nchs/nvss/bridged\\_race.htm](http://www.cdc.gov/nchs/nvss/bridged_race.htm).

Rates based on small numbers of cases (generally fewer than 20) should be viewed with caution and are considered unreliable because these rates have large standard errors and confidence intervals that can be wider than the rates themselves. Because of this, demographic values less than five (<5) have been suppressed throughout this report. For a more complete discussion of rates based on small numbers, please see the North Carolina Center for Health Statistics' publication, Statistical Primer No.12 "Problems with Rates Based on Small Numbers" by Paul Buescher. This publication is available at the website, [www.schs.state.nc.us/](http://www.schs.state.nc.us/).

## AIDS and HIV disease surveillance data

### **HIV Disease**

HIV disease case reports represent persons who have a confirmed diagnosis with human immunodeficiency virus. This category represents all new diagnoses with HIV regardless of the stage of the disease and is sometimes referred to as simply "HIV infection." Cases are counted by the date of diagnosis for the initial HIV diagnosis.

**AIDS case reports**, by contrast, represent only persons with HIV infection who have progressed to this later, more life threatening, stage of disease. AIDS cases are counted by the date of AIDS diagnosis. Most AIDS case reports represent persons who were diagnosed with HIV infection in earlier years. However, in North Carolina, about one-fourth to one-third of the new HIV disease reports represent persons who are initially diagnosed with HIV infection and AIDS at or very near the same time (concurrent). HIV disease reports and AIDS case reports should be considered separately. The two categories should never be combined to estimate an infected population, as the broad category of HIV disease includes AIDS cases that are counted by the initial diagnosis of HIV infection.

### **County of Residence**

Geographically, cases are counted by the patient's county of residence at diagnosis. Patients who are residents of a long-term facility such as prisons or other institutions are counted by the address of the facility. This causes the case counts for counties with large institutions to be higher than otherwise expected. People with HIV disease in the prisons play different roles in the epidemic from other residents in the county. In this annual report, persons diagnosed in long-term prison setting are excluded from county and regional case totals and rates. These cases are, however, included in state totals.

### **Year of diagnosis**

HIV disease is unlike most communicable diseases in that it is chronic in nature. Failure of providers to initially report cases and change in residence after initial diagnosis can complicate case counting. Therefore enhanced surveillance activities may artificially

result in fluctuations in the number of case reports counted by date of report. Tables in this report now display cases by date of diagnosis rather than date of report.

Tabulating case totals by date of diagnosis does delay the reporting of disease information. It takes at least six months from diagnosis for most cases reports to be verified and fully recorded in surveillance databases. Therefore, HIV morbidity data for 2011 was not available until July 1, 2012. This six-month delay in the presentation of HIV morbidity data for analysis will be an ongoing issue.

### ***HIV risk categories and distribution***

Notice of a change in this report: A new table is presented in this report (Table 14). For this table, we have reclassified cases with non-identified risk (NIR) or no risk reported (NRR). Because up to a third of our cases may be missing risk information, reassigning these cases to a risk group allows for a more complete picture of trends over time. Risk redistribution is only done for data at the state level. For more information on the specific methodology used, see the Epidemiologic Profile, Appendix C.

### **Chlamydia surveillance data**

Chlamydia case reports represent persons who have a laboratory-confirmed chlamydial infection. It is important to note that chlamydial infection is often asymptomatic in both males and females, and most cases are detected through screening. Changes in the number of reported cases may be due to changes in screening practices. The disease can cause serious complications in females, and a number of screening programs are in place to detect infection in young women. There are no comparable screening programs for young men. For this reason, chlamydia case reports are always highly biased with respect to gender. The North Carolina STD Surveillance data system underwent extensive changes in 2008 when the state implemented the North Carolina Electronic Disease Surveillance System (NC EDSS). During this transition, chlamydia morbidity counts for some counties may have been affected. Report totals since then should be considered with this in mind. Reports are summarized by the date received at the Communicable Disease Surveillance Unit rather than by date of diagnosis.

### **Gonorrhea surveillance data**

Gonorrhea case reports represent persons who have a laboratory-confirmed gonorrhea infection. Gonorrhea is often symptomatic in males and slightly less so in females. Many cases are detected when patients seek medical care. Others are detected through screening but to a far lesser degree than chlamydia cases. Gonorrhea can cause serious complications for females and a number of screening programs exist targeting this population. There is less screening of males because they are more likely to have symptoms that would bring them to the STD clinic; therefore, gender bias in gonorrhea reporting is not likely to be large. Public clinics and health departments may do a better job of conducting such screening programs and reporting cases, causing the reported cases to be biased toward those attending public clinics. During

the transition to NC EDSS, gonorrhea morbidity counts for some counties may have been affected. Report totals since then should be considered with this in mind. Reports are summarized by the date received at the Communicable Disease Surveillance Unit rather than by date of diagnosis.

### **Syphilis surveillance data**

Syphilis cases are reported by stage of infection, which is determined through a combination of laboratory testing and patient interviews. Primary and secondary syphilis have very specific symptoms associated with them, so misclassification of these stages is highly unlikely. Early latent syphilis is asymptomatic but can be staged with confirmation that the infection is less than a year old. Together, these three stages that occur within the first year of infection are called “early syphilis.” This report includes only early syphilis cases, though other later stages are reported to the Communicable Disease Surveillance Unit. Because North Carolina performs patient interviews, partner notification, and contact tracing on all early syphilis cases, the quality of the early latent case data is also quite good. Screening programs are more likely to detect asymptomatic cases, which may introduce some bias in the early latent case reports toward screened populations (pregnant women, jail inmates, others). However, thorough contact tracing further aids in case detection and reduces these biases. Reports are summarized by the date received at the Communicable Disease Surveillance Unit rather than by date of diagnosis.

### **For more information**

For a more detailed discussion of the content, strengths, and weaknesses of STD and HIV surveillance data, please see Appendix B of the most recent *HIV/STD Prevention & Community Planning Epidemiologic Profile for North Carolina*. Recent trend information can also be found on the fact sheets available at the web site, <http://epi.publichealth.nc.gov/cd/stds/figures.html>.

## Map

North Carolina Geographic Regions.....	back cover
--	------------

## Highlights

- As of December 31, 2012, the estimated number of living HIV disease cases diagnosed and reported in North Carolina was 27,068 (Table 1).
- For 2012, 1,409 new diagnoses of HIV disease were reported (Table 3).
- For 2012, 798 new diagnoses of AIDS were reported (Table 6).
- The three-year (2010-2012) average rate of diagnosed HIV disease in North Carolina was 15.1 per 100,000 population. The top five counties with highest rates were Mecklenburg (34.0 per 100,000), Edgecombe (31.4 per 100,000), Durham (28.2 per 100,000), Cumberland (24.4 per 100,000), and Wilson County (24.2 per 100,000) (Table 2).
- Among the HIV disease cases diagnosed in 2012, African Americans represented 65 percent of all cases with a rate of 53.2 per 100,000 adult/adolescent population. The highest rate (86.9 per 100,000) was among adult/adolescent African American males (Table 11).
- For 2012 adult/adolescent HIV disease cases, men who have sex with men (MSM) was the principal risk factor indicated in 64 percent of total cases, heterosexual transmission risk was indicated in 32 percent, injecting drug use (IDU) was indicated in 3 percent, and MSM/IDU was indicated in 1 percent of total cases (Table 14).
- The reported number of early syphilis cases in North Carolina in 2012 was 598, with a rate of 6.2 per 100,000 population (Table 10).
- The top five counties reporting most early syphilis cases in 2012 were Mecklenburg (134), Wake (84), Guilford (66), Forsyth (43), and Pitt (35) (Table 10).
- African American males had the highest rate of early syphilis (39.5 per 100,000), and represented 65 percent of total early syphilis cases in 2012 (Table 23).
- The reported number of chlamydia cases in 2012 was 50,606. (Table 7).
- Among female chlamydia reports in 2012, the age groups with highest rates were 20-24 year olds (4,782.2 per 100,000) followed by 15-19 year olds (4,327.4 per 100,000) (Table 18).
- The reported number of gonorrhea cases in 2012 was 14,322 (Table 8).
- In 2012, African American females and males had the highest gonorrhea rates (374.4 and 339.5 per 100,000 respectively), and represented 29 percent and 23 percent of total cases (Table 19).
